Sedukopi Data Analytics

Menu Optimization & Bundling Strategy

By:Rizcki Pangestu

Overview

Background & Problems

Unlocking the hidden potential of Sedukopi’s sales data in the competitive F&B industry to maintain profitability.

Data Understanding

Collection, cleaning, and analysis of the Sedukopi dataset (2022–2025) to ensure accurate, data-driven decisions.

Strategy & Recommendations

Application of the Boston Matrix and cross-selling strategies to develop actionable bundling packages and menu optimization.

Background & Business Strategy

In the competitive F&B industry, data-driven decision-making is key to profitability. As the number of transactions increases, Sedukopi’s sales data holds the potential to:

- Identify which menu items are truly profitable.
- Design targeted promotions based on customer habits.

Core Questions:

- Which menu items are bestsellers but have low profit margins, and which “hidden gem” items should we start promoting right away?
- Which menu item combinations show the most promise for creating bundled packages?

Data Understanding

Dataset Overview

The analysis was conducted using the **Sedukopi Dataset (2022–2025).**

Tools & Materials

The use of various data analysis libraries to extract and model information from key columns (Order ID, Quantity, Price, Cost).

Data Collection & Cleaning

A thorough cleaning process has been carried out.

Results: No null values, duplicates, or outliers were found..

Descriptive Statistics

Preliminary analysis indicates the existence of a **popularity paradox**:

- The Coffee category serves as the main driver of sales volume.
- The Food category is the largest contributor to profits.

This indicates that coffee products have lower profit margins than food items.

Significant Differences:

Top 3 Best-Sellers: Matcha Espresso Fusion, Cheesecake Slice, Butter Croissant.

Top 3 Most Profitable: Club Sandwich, Almond Croissant, French Toast.

Boston Matrix Classification

Based on the findings regarding profitability versus volume, menu performance is classified into three main segments:

High Volume & Low Margins

Menu: Matcha Espresso Fusion, Cheese Cake Slice, Soda Gembira, Macchiato, Taro Latte.

Serves as the main source of traffic to the shop.

Hidden Gem (High Margin, Low Volume)

Menu: French Toast, Spaghetti Carbonara, Salad Caesar, Mie Goreng Jawa, Sandwich Tuna.

Significant profit potential whose sales have not yet been maximized.

Low Volume & Profit

Menu: Earl Grey, Cookies Chocochip, Cinnamon Roll, Matcha Latte, Kue Sus Vanilla.

It creates an operational burden and poses a risk of food waste.

Actionable Recommendations

1. Use the “Bait Menu” Strategy

Maintain the quality of high-volume menu items. Use these popular menu items as a draw in promotional packages to promote other menu items.

2. Aggressive Promotion for “Hidden Gems”

This menu is the key to increasing profits. Instruct cashiers to actively recommend items and implement data-driven cross-selling strategies.

3. Evaluation of the Bottom Menu

Temporarily suspend operations for menu items with low volume and profit (Earl Grey, etc.) to optimize raw material costs.

Data-Driven Cross-Selling Strategy

Recommendations for Special Bundle Combinations to boost the “Hidden Gem” menu based on historical transaction data:

Target: French Toast
Pair with: a strawberry smoothie, a Caesar salad, or an avocado shake.

Target: Spaghetti Carbonara
Pair it with: a club sandwich, an iced latte, or a piccolo.

Target: Salad Caesar
Pair with: French toast, chicken sandwich, or Javanese fried noodles.

Target: Mie Goreng Jawa
Pair with: Cappuccino, Caramel Macchiato, or Piccolo.

Target: Sandwich Tuna
Pair with: Spaghetti Aglio Olio, Nasi Goreng Spesial, or Mocha.

Conclusions

Menu optimization isn’t just about looking at what sells the most, it’s about balancing volume with profitability.

- Shift in Focus: Coffee attracts customers; food secures profits.
- Smart Bundling: Using loss leaders (high volume) to sell “hidden gems” (high margin) is the most efficient strategy for increasing Average Order Value.
- Efficiency: Cutting out low-margin menu items reduces the risk of losses
